

ME370 Postlab 11

Shihong Yuan

Lab TA: Tim Han
Lab Session: Friday 1:30am-2:50am
November 18, 2025

Inlab Activities

Question 1

```

1 % --- Section 1 ---
2
3 # Comments:
4 # Because all the link has there center in the middle of the object, so we use 0.5
5 cmlink = [0.5, 0.5, 0.5, 0.5] #Fractional link distance from 1st node where the
   center of mass lies
6 # Because all are only one rigid body
7 cmatbody = [[0], [1], [2], [3]] #Defining rigid bodies as a array
8 # In the manual it suggests to use this value
9 gconst=9.81 #gravitational constant in m/s^2 (positive)
10 #If neglecting gravity, gconst = 0.
11 wdth=0.0254 #Width of each link (meters).
12 tks=0.003175 #thickness of each link (meters).
13 den=1180 #Density for each link (kg/m^3).

```

Listing 1: Python code for Section 1: Input.

Question 2

```

1 % --- Section 3 ---
2
3
4 # Comments:
5 # rcenter=(1-c)*r1 + c*r2
6     rcglink[i][k] = r1link[i][k] * (1 - cmlink[i]) + r2link[i][k] * cmlink[i] #
   ##### FILL IN LINK CG CALCULATIONS HERE

```

Listing 2: Python code for Section 3: Moments of Inertia.

```

1 % --- Section 4 ---
2 for k in range(tnum-1):
3 # Comments:
4 # for derivation we will use the difference divide by 2*dt
5 # for k=0, we have to use 1*dt
6     if k==0:
7         omega[:,k] = (theta[:,k+1] - theta[:,k]) / dt
8         # FILL IN OMEGA CALCULATION #####
9     else:
10        omega[:,k] = (theta[:,k+1] - theta[:,k-1]) / (2*dt)

```
1 % --- input torque Section 9 ---
2 # Comments
3 # we can just use the torque variable with crank angle variable
4
5 plt.figure()
6 plt.plot(crank_angle[0:tnum-2], torque, linewidth = 2)
7 plt.title('Motor Torque vs Crank Angle')
8 plt.xlabel('Crank Angle (Degrees)')
9 plt.ylabel('Torque (Nm)')
10 plt.grid(1)
```

Listing 6: Python code for Power Analysis: Input Torque.

Screenshots

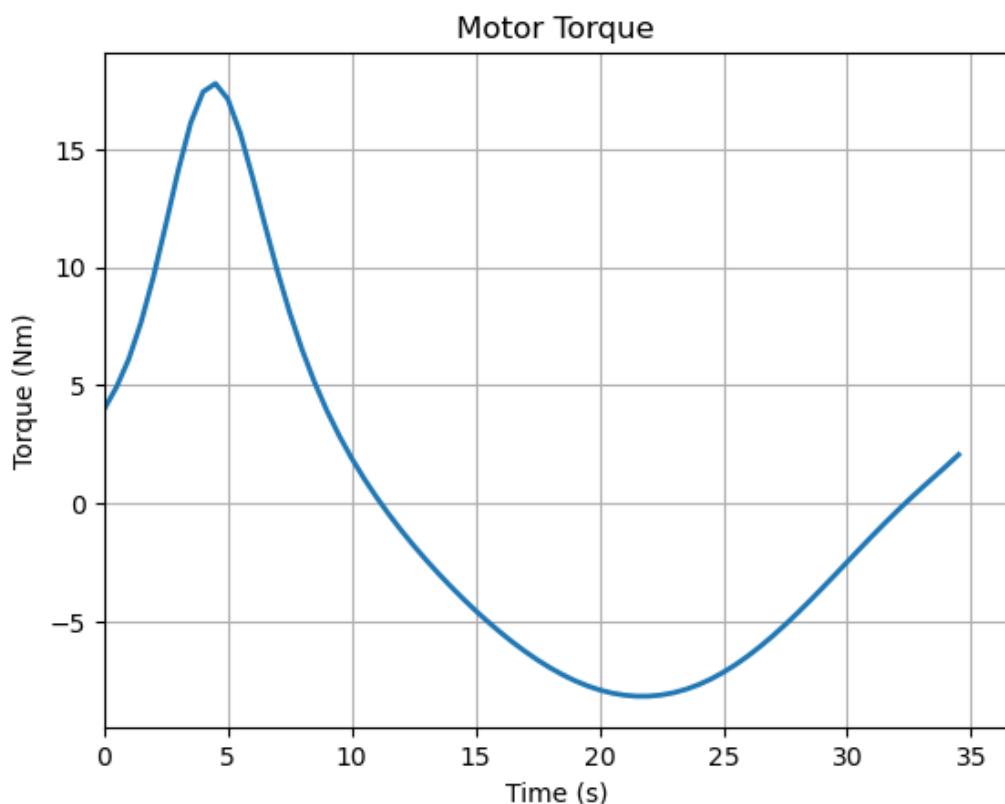

Figure 2: Torque vs Time

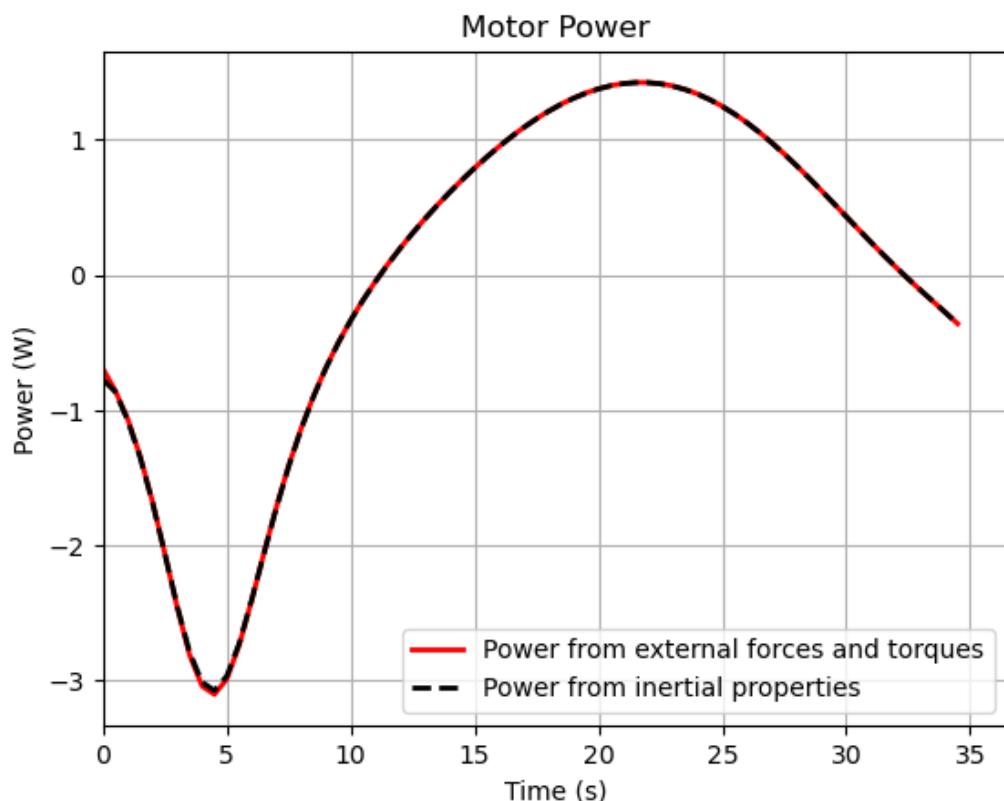

Figure 3: Two kinds of Power vs Time

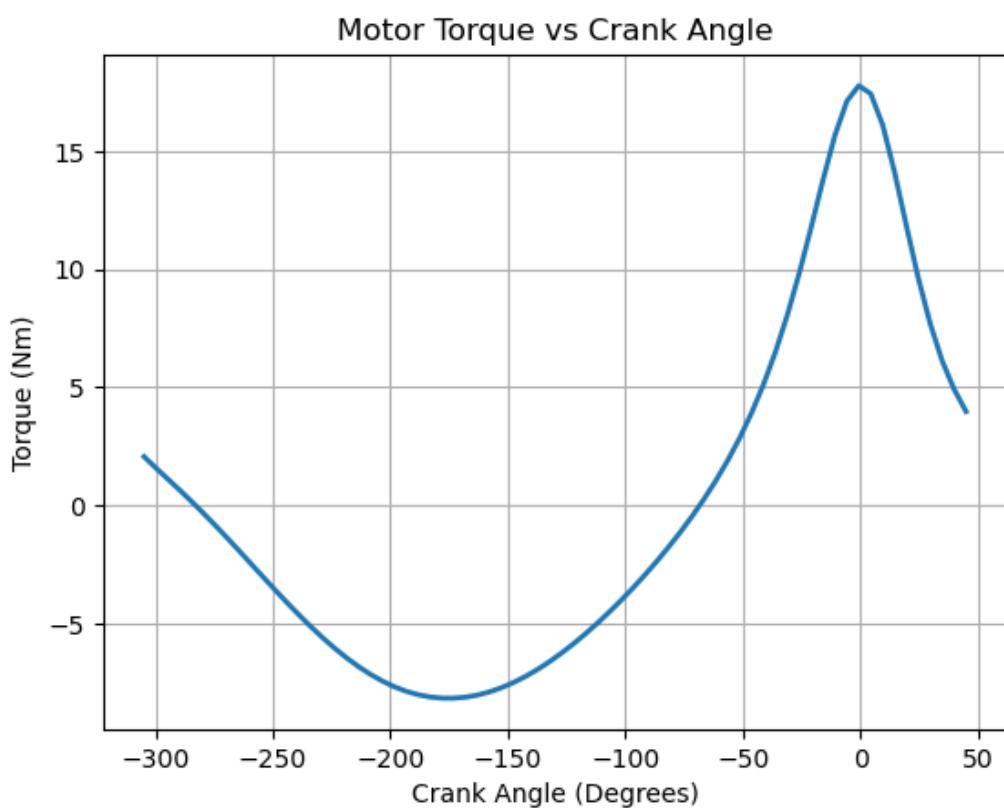

Figure 4: Toque vs Crank Angle

Postlab Q1: Plots of Slider Motion

The following plots show the position, velocity, and acceleration of the horizontal slider (node 5) as a function of time for four full cycles of the crank. The crank angular velocity was set to 40 degrees/second to complete one revolution in 9 seconds.

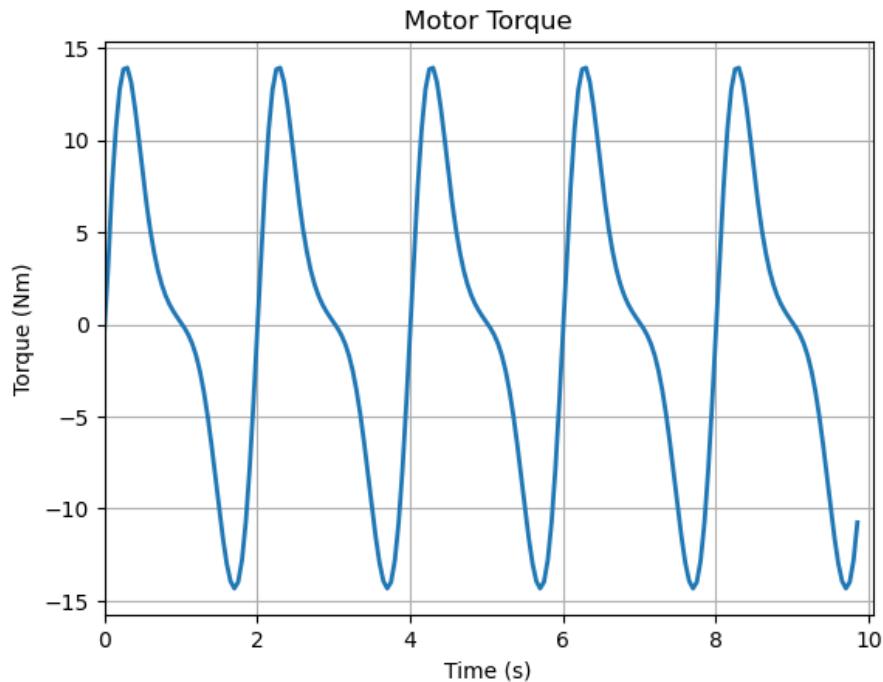

Figure 5: Position of the horizontal slider (Node 5) vs. Time.

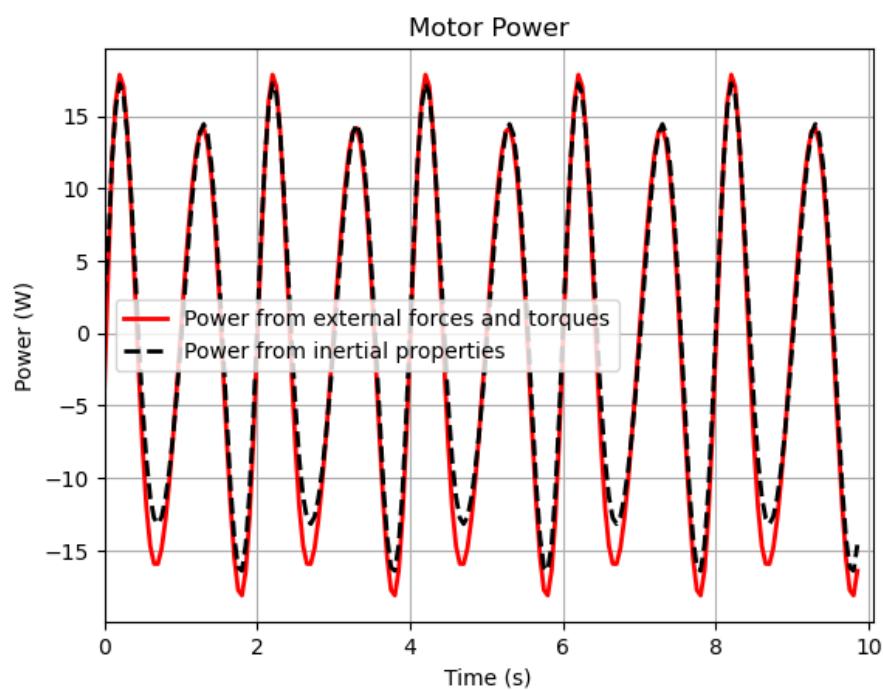

Figure 6: Velocity of the horizontal slider (Node 5) vs. Time.

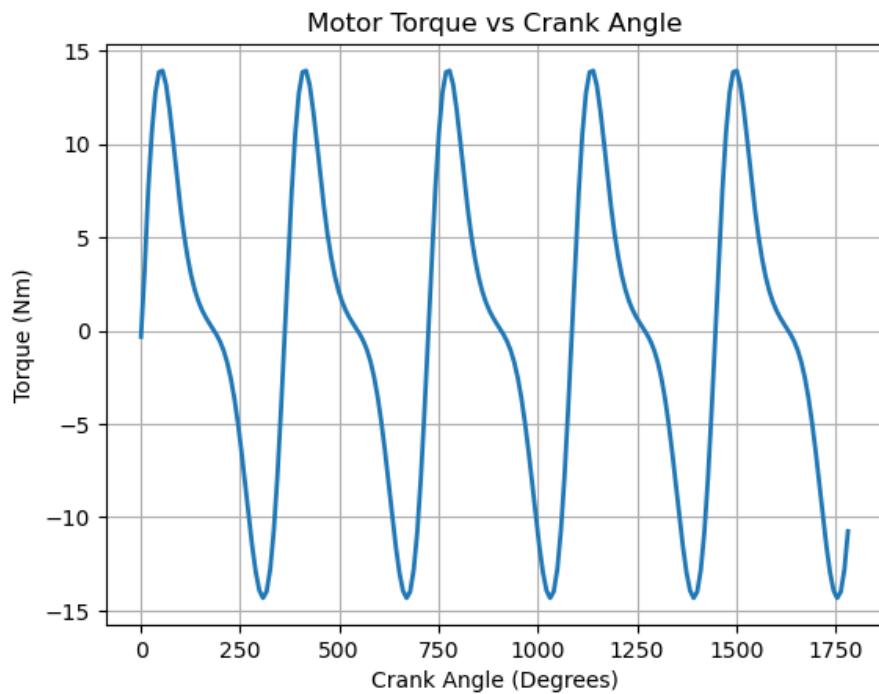

Figure 7: Acceleration of the horizontal slider (Node 5) vs. Time.

Postlab Q2: Modified Code and Commentary

Section1

```

1 # the center of circle is in O2
2 cmlink = [0.5, 0, 0.5, 0.5, 0.5] #Fractional link distance from 1st node where the
   center of mass lies
3 #Defined in the order cmat is defined in the PVA
4 cmatbody = [[0], [1], [2], [3,4]] #Defining rigid bodies as a array
5 #Note that in PVA, each link was defined to be binary. Links modeled with a fixed
   angle constraint are physically rigid
6 gconst= 0#gravitational constant in m/s^2 (positive)
7 #If neglecting gravity, gconst = 0.
8 wdth=0.1#Width of each link (meters).
9 tks= 0.1#thickness of each link (meters).
10 den= 2500#Density for each link (kg/m^3).

```

Postelab Q3. AI Statement

Select one of the following options:

- a) My answer was created by a Gen AI algorithm, and I have not modified it
- b) My answer was created by a Gen AI algorithm, and I have some minor changes.
- c) My answer was created by a Gen AI algorithm, and I have made major changes.
- d) My answer was created solely by myself.**
